PREFACE

This report provides highlights on the demographic and economic characteristics of racial minorities in North Dakota, 1970 to 1980. Data for this report were found in the following Bureau of the Census publications:

1980 Census of Population, General Population Characteristics: North Dakota. PC80-1-B36 U.S. Department of Commerce, Bureau of the Census.

1980 Census of Population, General Social and Economic Characteristics: North Dakota. PC80-1-C36. U.S. Department of Commerce, Bureau of the Census.

1980 Census of Population, Summary Tape File 4. U.S. Department of Commerce, Bureau of the Census.

The report describes persons who identified themselves as memberS of one of the following racial minority groups: American Indian, Eskimo, Aleut, Black, Japanese, Chinese, Filipino, Korean, Asian Indian, Vietnamese, or other. The category "Other" includes persons who classified themselves in racial minority groups such as Cambodian, Laotian, Pakistani, Hawaiian, Guamanian, Samoan, and Fiji Islander. In this report, households and families are classified by the race of the householder.

Narrative Highlights of Racial Minority Groups

Number

The number of residents in North Dakota who identified themselves as a racial minority increased by nearly 8,900 or 48.6 percent between 1970 and 1980. The largest gain was among the state's Native Americans who expanded their number by more than 40 percent. With the exception of the Japanese, many more people from East Asia resided in the state in 1980 compared to 1970 (Table 1 and Figure 1).

Gender

Overall, the racial minority groups in North Dakota were comprised of slightly more males than females in 1980 (50.9 percent and 49.1 percent, respectively). However, there were marked differences in gender mix among the different minority groups in the state. The most dramatic difference between genders appeared among Blacks in North Dakota. In 1980, Black males outnumbered Black females by 30 percent. Among the Japanese and Filipinos, the opposite was true with 23 percent more females residing in the state than males in 1980 (Table 2).

Age

In 1980, fully half (50.0 percent) of all racial minorities in North Dakota were under 20 years of age while only 5 percent (5.3 percent)

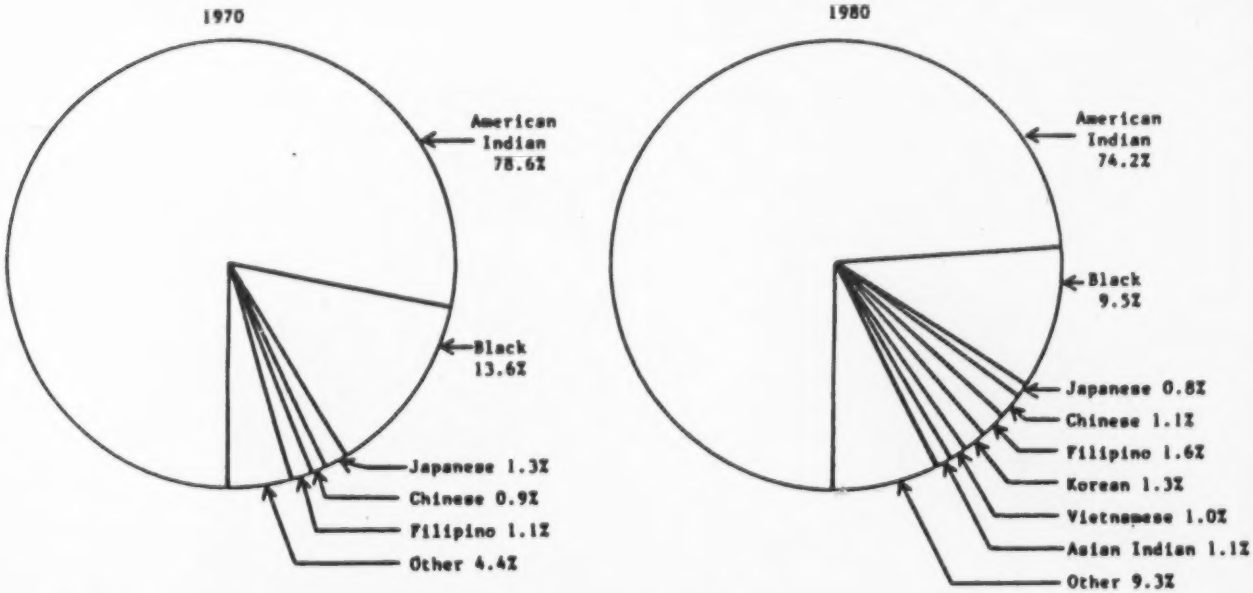

Figure 1. Racial Minority Groups in North Dakota, 1970 and 1980.

Note: Percentages are based on a total of all racial minority group members.

TABLE 2. RACIAL MINORITIES IN NORTH DAKOTA BY GENDER, 1970-1980

SOURCE: U.S. Bureau of the Census, PC80-1-B36, Tables 17 and 22.

were over 60 years of age. However, there were important differences in the age structure of the various racial groups. For example, the median age of American Indians, Eskimos, and Aleuts in North Dakota was 18.9 years while the median age for Japanese and Asian Indians was over 30 years. This is because nearly 53 percent of the American Indians, Eskimos, and Aleuts in the state were less than 20 years old while only half that proportion of Japanese and Asian Indians were under age 20 in 1980. In contrast, nearly 8 percent of all Asian Indians in North Dakota were 70 years of age or more in 1980 while elderly (70 and over) American Indians and Eskimos accounted for only 2.5 percent of their population (Table 3).

Education

Racial minorities in North Dakota, with the exception of the Vietnamese, American Indians, Eskimos and Aleuts, had educational attainment levels above those of whites in the state in 1980. Asian Indians were the most educated of all racial groups in North Dakota (Table 4 and Figure 2). Nearly two of every three (61.2 percent) above the age of 24 completed four or more years of college. Among the adult Asian Indians, males were more educated than females with 87.3 percent completing four or more years of college compared to just over one-third (38.0 percent) of Asian Indian women reaching that level in 1980.

Vietnamese were the least educated racial group in North Dakota in 1980. Slightly less than one-third (31.3 percent) of all adult Vietnamese over age 24 had completed fewer than nine years of formal education in 1980. Only 2.7 percent of the Vietnamese adults over age 24 had completed four or more years of college. Similar to the Asian Indians, Vietnamese women were less educated than Vietnamese men. Over one-third (36.6 percent) of the Vietnamese women age 25 and over had completed eight or fewer years of education in 1980 compared to slightly less than a quarter (22.0 percent) of the men.

Fertility

Fertility levels (as measured by the number of children ever born per 1,000 women in the population) among most racial minority women

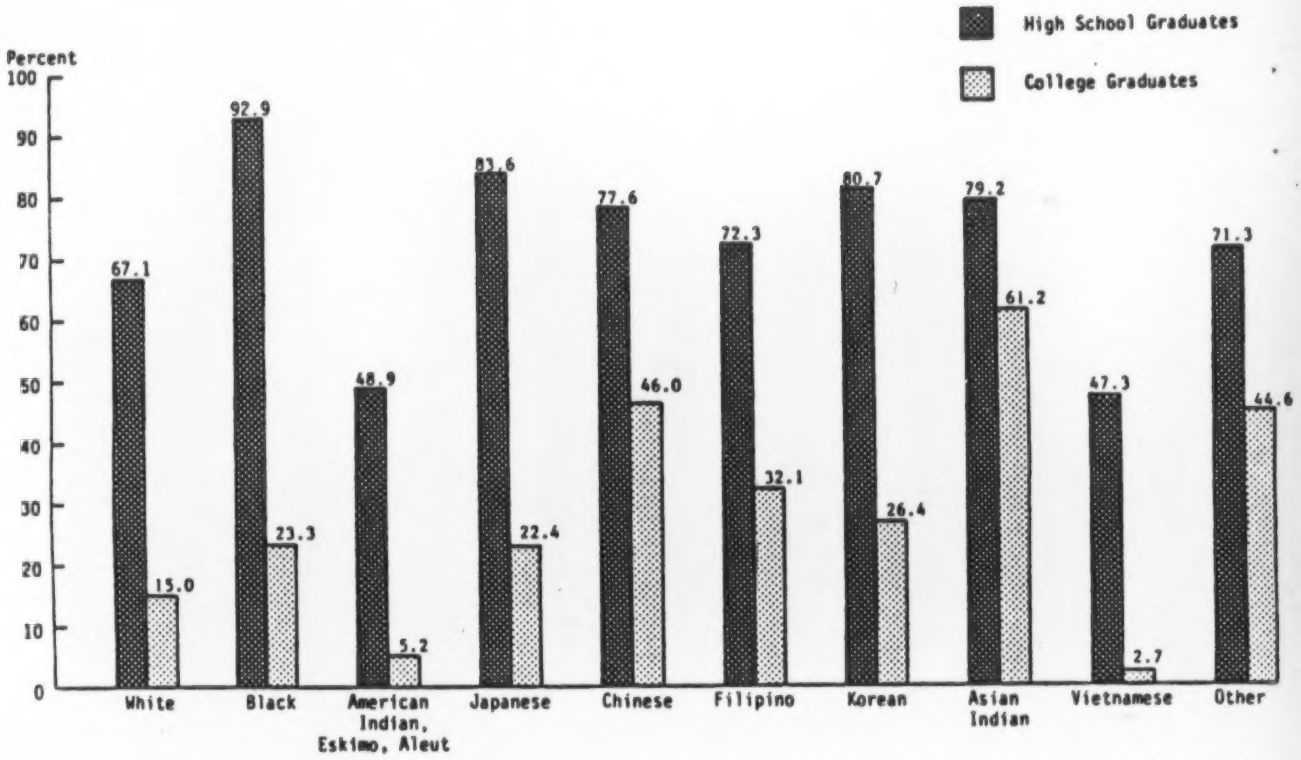

Figure 2. Percent of Persons Age 25 Years and Over Who are High School or College Graduates, by Racial Minority Group, 1980.

Note: Percent having completed high school include the categories, "high school," "some college," "4 years college," and "5 or more years college."

were higher than for the general population of North Dakota women in 1980 (Table 5). The fertility level of Vietnamese women age 15-24 years in North Dakota was more than seven times greater than the rate for North Dakota women of that age as a whole (2,154 and 305 children born per 1,000 women, respectively).

Similar high levels of fertility were reported among Vietnamese women in the 25 to 34 year age cohort relative to other racial groups in 1980. A high fertility level in the 25 to 34 year age cohort was also found among women belonging to the racial minority groups listed in the "Other" category. Interestingly, Asian Indian women in the 25 to 34 age group had a fertility level far below that of other racial minority women and below that of the general population of North Dakota women in 1980 (Table 5).

Fertility levels among racial minority women in the 35 to 44 year age cohort varied markedly from the average for women in North Dakota. American Indian, Eskimo, and Aleut women showed the highest fertility level for the 35 to 44 year age group with 4,898 children born per 1,000 women in 1980. Korean women had the lowest fertility level in this age cohort with 1,034 children born per 1,000 Korean women age 35 to 44 years in North Dakota in 1980.

The number of children born to single mothers differs greatly among racial groups and by age of mother (Table 6). Single mothers who were never married are disproportionately represented by the young. Of the births occurring to white women under the age of 25, nearly one in ten were to mothers never married. Births to single mothers in that age group were nearly twice as

high for Blacks and four times as high for American Indians and Koreans. The five births which occurred to Japanese women under 25 years of age in 1980 were all to single mothers.

women. Only among American Indian and Chinese women were more than one percent of the births out of wedlock. The highest proportion (8.7 percent) of births to single mothers 25 to 34 years of age was among American Indians, Eskimos, and Aleuts.

Marital Status

Forty-five percent of all racial minority men in North Dakota were single in 1980. In comparison, nearly one-third (31.3 percent) of all racial minority women in North Dakota were single in 1980.

Compared to other racial groups in North Dakota, Japanese had the highest proportion of single men (58.5 percent) while American Indians, Eskimos, and Aleuts reported the highest proportion of single women (35.1 percent) in 1980. In contrast, Asian Indian men were most likely to be married (59.3 percent) among racial groups as well as Korean women (85.4 percent) in 1980 (Table 7).

When comparing each racial minority group separately, however, labor force participation rates vary considerably. Blacks in North Dakota had a labor force participation rate of 87.1 percent in 1980 while only 52.5 percent of all American Indians, Eskimos, and Aleuts aged 16 and over participated in the labor force in 1980 (Table 8 and Figure 3).

Unemployment

In North Dakota, 17.1 percent of all racial minority persons in the labor force were unemployed in 1980. This rate was more than three times higher than the unemployment rate for all North Dakotans in 1980.

SOURCE: U.S. Bureau of the Census, PC80-1-B36, Tables 21 and 22.

Divorce rates were highest among American Indians, Eskimos, and Aleuts. Divorce in this racial minority group occurred nearly twice as frequently in 1980 than in any other racial minority group in North Dakota. The racial minority group reporting the lowest level of divorce in 1980 was Asian Indians.

Labor Force Participation

In 1980, 57.7 percent of all persons identified as a racial minority who were age 16 years and over in North Dakota participated in the labor force. This rate was lower than the 61.4 percent labor force participation rate for all persons age 16 and over in North Dakota.

When looking specifically at each racial minority group in North Dakota, American Indians, Eskimos, and Aleuts had the highest unemployment rate (19.2 percent) in 1980. Persons belonging to various Other racial groups not listed separately had the lowest unemployment rate (2.3 percent) in 1980. The Korean, Asian Indian, and Vietnamese did not report any unemployment (Table 8).

Income

Median household income among racial minority groups in North Dakota showed marked variation in 1979. Vietnamese in North Dakota had a median household income of $8,173 in 1979 while Filipinos had a median household income three times that level ($25,625).

Over one quarter of Chinese households (25.5 percent) and almost one-third (32.0 percent) of all Filipino households in North Dakota made $50,000 or more in 1979. In contrast, well over one quarter of all American Indian, Eskimo, and Aleut (27.1 percent) and Asian Indian (29.9 percent) households in North Dakota made less than $5,000 in 1979. Interestingly, there were nearly equal proportions of Other racial minority households (those belonging to a minority group not listed separately) making less than $5,000 as there were making $50,000 or more in 1979 (28.9 percent and 26.7 percent, respectively) (Table 9 and Figure 4).

Chinese families had the highest median family income ($36,504). The next highest median family incomes were earned by Asian Indian and Filipino families who earned $32,183 and $31,849, respectively. The lowest median family income was earned by Vietnamese families ($6,908). The highest median family income for families with no workers was that of Black families ($11,250) whereas the lowest was that of Other families ($2,500). The highest median family income earned by families with only one worker was earned by Chinese families ($58,350). The lowest was earned by Vietnamese families ($6,563) (Table 10).

Occupation

The occupational category in which the largest proportion of persons in each racial group were employed in 1980 (with the exception of Asian Indians and Filipinos) was that of service occupations. The largest proportion of Koreans, Chinese, Vietnamese, and Japanese were employed in food service occupations in 1980. In contrast, the largest proportion of employed American Indians, Eskimos, and Aleuts, and Blacks were in cleaning and building service occupations excluding household cleaning services (Table 10).

The largest percentages of Asian Indians and Filipinos in North Dakota were employed in professional specialty occupations in 1980. Nearly one third (29.1 percent) of all employed Asian Indians were teachers, librarians, or counselors while an equal proportion (31.6 percent) of all employed Filipinos were in health diagnosing occupations in 1980 (Table 11).

Poverty

There were marked differences in rates of impoverishment among racial groups in North

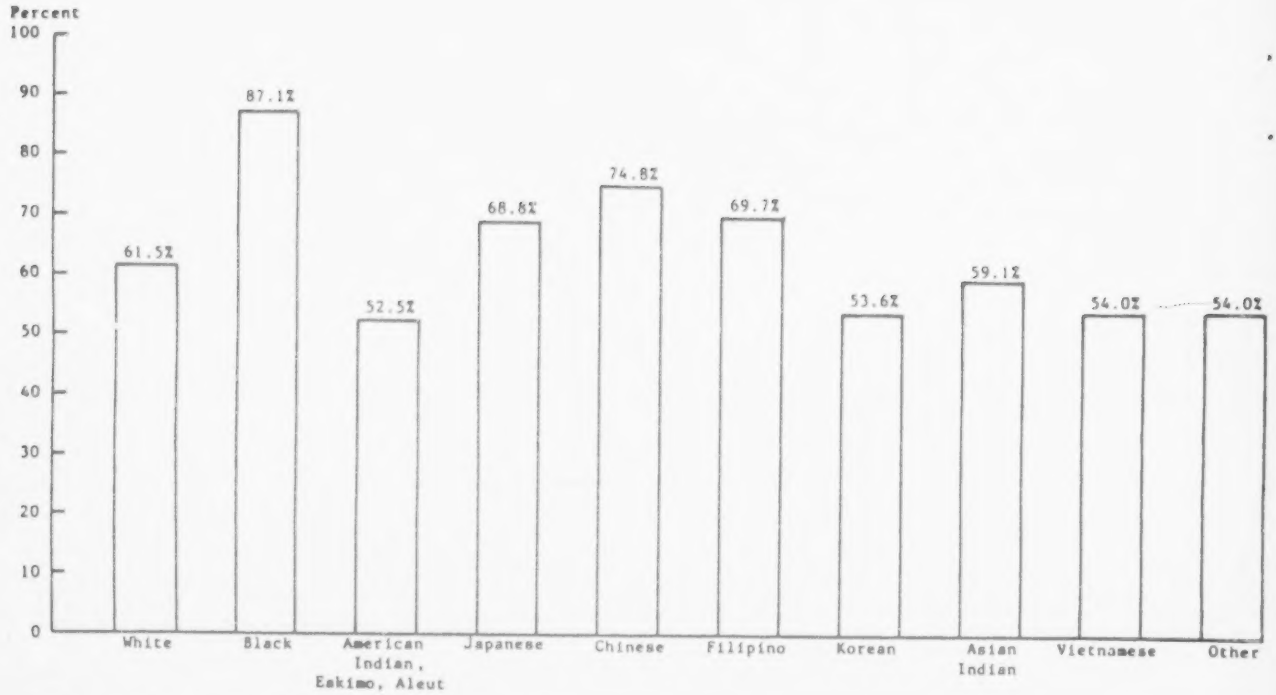

Figure 3. Labor Force Participation of Racial Minority Groups in North Dakota, 1980.

Note: Percent of all individuals of a racial group over age 16 in the labor force.

Dakota. Nearly 40 percent of all American Indian, Eskimo, and Aleut persons in North Dakota were impoverished in 1979. This proportion is more than three times the level of impoverishment for North Dakota in general. Vietnamese and Other racial groups not listed separately also reported percentages of impoverishment markedly higher than that for the state overall in 1979 (Table 12).

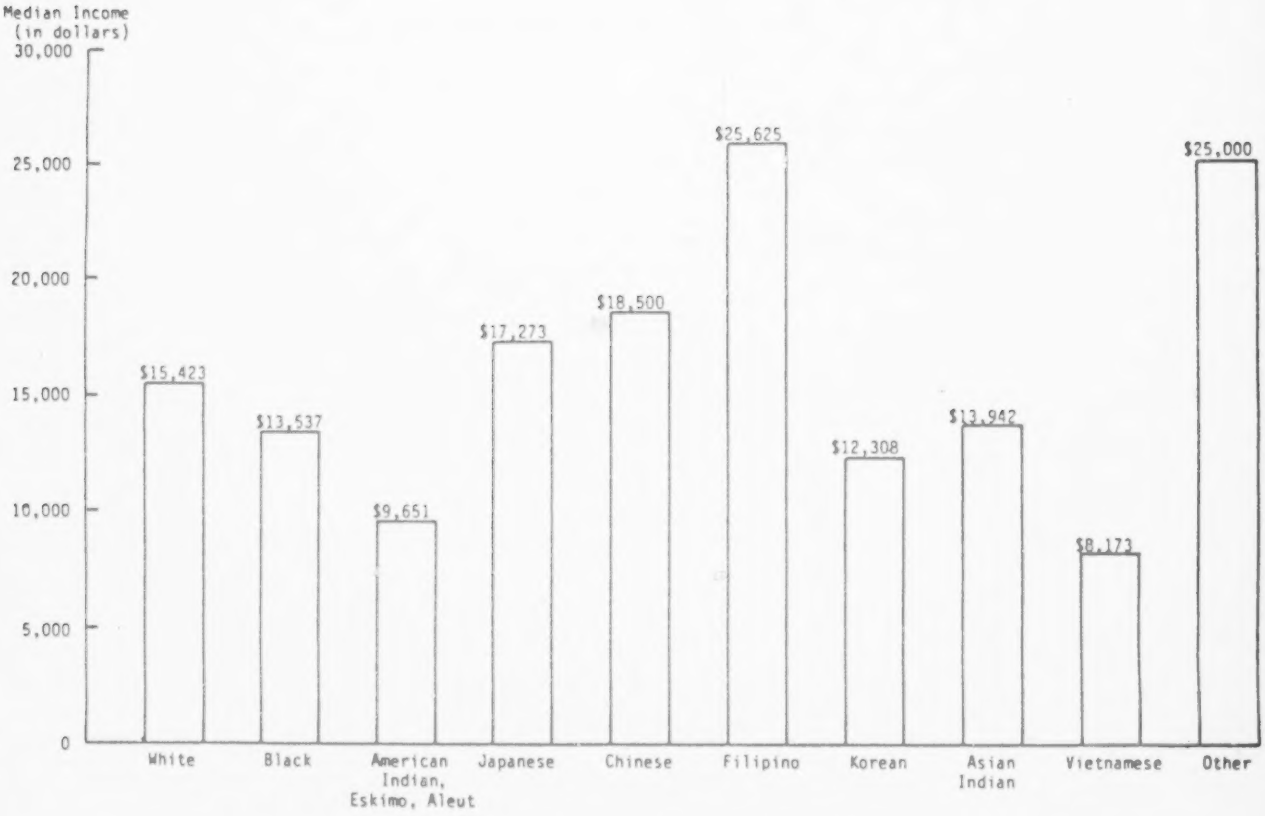

Figure 4. Household Income of Racial Minority Groups in North Dakota, 1979.

Well over half of all impoverished Vietnamese, American Indians, Eskimos, and Aleuts were children under the age of 18 related to an impoverished householder. In contrast, 3.2 percent of all Vietnamese, and 3.6 percent of all American Indians, Eskimos, and Aleuts falling below the poverty line in 1979 were age 65 or older.

SOURCE: U.S. Bureau of the Census, PC80-1-C36, Tables 82 and 98.

When focusing specifically on families, Vietnamese, American Indians, Eskimos, and Aleuts showed the highest proportions of persons living in poverty in 1979. Over 45 percent (45.7 percent) of all Vietnamese families in North Dakota were impoverished in 1979. This proportion is five times the level of impoverishment for North Dakota families in general. Nearly 48 percent of all impoverished American Indian, Eskimo, and Aleut families were headed by females with no husband present. Over 96 percent of these female-headed households contained children under 18 years of age. In contrast, none of the Vietnamese families in poverty were female headed, although all 16 impoverished Vietnamese families did have children under age 18 in 1979.

Filipinos and Japanese reported poverty rates markedly lower than those for North Dakotan's in general in 1979. Five and one half percent of all Japanese persons in North Dakota were impoverished in 1979 while only 4.3 percent of all Filipino persons in the state fell below the poverty line in 1979. Japanese, Korean and Asian Indian families reported no families living in poverty in 1979.
